In the first week of the summative it went really smooth and I was pretty productive and that was most likely due to the fact that I was going away for a week and didn't want to overload myself with work once back. I was happy that I had a clear idea in my head during planning so it made finding everything and making sure each thing fit together go away quicker and could move onto personas and field reviews and spend more time on them.

I think this is the most unsure of the work I was doing due to the lockdown and isolation of the university and country. While I was reading , watching and seeing everything was posted and sticking to the brief I still found myself questioning a lot, which might of been because after the week I was away I had to go into self isolation so I missed the last of the classes before the university so I missed out on some details that were told in class.

The work itself I wish I put way more effort into the site I ended up making as I don't believe it is how it should be, when I thought I was done and looked back at it I noticed that if I was just a visitor of the site itself I would find it weird to navigate and not that interesting. I found when coding everything I wanted to keep changing the design and when I did change aspects of the design I would see something else and want to change it all over again.

I did find having to do all the work on my own and not being able to ask questions in person or showing me how to do something actually helped me understand how and what I was coding a lot more and while it doesn't look as what I wanted it to look like I found I put in the effort in some aspects to understand what did what which is more than last time.

I think the planning and production of everything went well and I stayed on track and completed everything to a standard I liked. I do think like the last summative I fell off once it came to the summative and trying to stick to what I designed in the high fi. I think next time before I get to the lofi planning I need to look at what I can code and what may be more difficult because as soon as I did come across something that wouldn't work I did just shove an image in with text already there. I also found that as soon as it came to coding my motivation for doing anything was lost and if we hadn't gotten an extension I don't know how much of the website I would've finished. I don't know if losing motivation was due to not being able to get as much or even just sitting in the lab and doing work.

For this summative I found everything to be up and down and I questioned a lot of the work I was making even when following the brief or what was said to do. Like

the last summative I do wish I stayed closer to the original design of the hifi as it means I don't have to go back and change things once I'm done coding the website.

For the next summative I want to do research on different designs and code even if that is watching videos or going through w3schools more because I found there were a lot of elements I liked and wanted to understand them more but felt like I didn't have the time during this summative. Not knowing what the teaching situation is going to be like for next term I think setting up a station where there are no distractions and taking timed breaks could help me more to stay motivated and on track when it comes to coding.
